Heart diagram student worksheet. doc

Date name: _____ The human heart is similar to the heart of other vertebrates of mammals and birds (and some reptiles). There is something called a looping circulatory system, in which the blood from the heart goes to the lungs, where it becomes oxygenated, then returns to the heart before sending oxygen blood to the rest of the body. The heart has four chambers, and most diagrams show the heart, as viewed from the abdominal side. This means that when you look at the left heart, it means the patient. Left and not your left. **For each number described below, label on the heart diagram** The blood that travels through the body supplies nutrients to the tissues, eventually returning to the heart through the superior vena cava (7) and inferior vena cava (8), the blood enters the right atrium (1), where a slight contraction pushes the blood through the tricuspid valve (A) and into the right ventricle. (2) From the right ventricle, the blood is pushed out through the pulmonary valve (B) and into the pulmonary trunk (5) this artery is divided into two arteries, the left lung artery (5L) and the right lung artery (5R), which sends blood to the lungs where it becomes oxygenated. Oxygen blood returned from the lungs through the left and right pulmonary veins (9), which flow into the left atrium (3) from the left atrium, blood passes through the bicuspid valve, which is called the mitral valve (D), and enters the most muscular part of the left ventricle. (4) the effective contraction of the left ventricle sends blood through the aortic valve (C) and into the body's largest artery, aorta (6), blood enters the artery and travels to the shoulder artery through three small arteries: brachiocephalic (6a), carotid, General left (6b) and left subclavian (6c) aorta form an arch, as blood is directed to the lower part of the body, where it oxygenates organs and muscles. Read the description carefully and track the blood flow in the heart. Use the blue arrow to identify deoxygenated blood and red arrows to identify oxygen blood. Mitral regurgitation is a heart condition that occurs when the mitral valve is not sealed off from your knowledge of the heart, explaining what happens to the blood of people with this condition (if you really stumble, look up!). When you put your hand on your heart, you use your right hand. This is because you feel more of your heart on the left side of your chest, even if the heart is centered in the chest cavity. Why do you feel your heartbeat so much on the left? Aortic stenosis defects occur in some newborns that the visor (E) does not completely close during development. This can cause blood leakage between valves. What kind of blood is most likely to travel? Described 5, 6, 7, 8, 9, 10, 11, 12. HomeschoolPage 26th, 8, 9, 10, 11, 12. Higher Education, Adult Education, Home School, StaffPage 36th, 7th, 8th, 9th, 10th, 11th, 12th, Higher Education, Adult Education, Home School, StaffPage 43, 4th, 5th, 6th, 7th, 8th, 9th, 10th, 10th, 10th Home School Page 55, 6, 7, 8, 9, 10, 11th, 12th, HomeschoolPage 63, 4th, 5th, 6th, 7th, 8th, 9th, 10th, HomeschoolPage 76th, 7th, 8th, 9th, 10th, 11th, 12th, 12th, Higher Education Adults, Homeschool Employees, if you are for no resource, download your mine, move to mine, follow all of them, share the same resources. Not for those who want to destroy the collaborative community. A simple diagram of the heart with a label to enhance and exercise coagulation on the pathway of blood through the heart. Diagrams can be painted as needed and easily edited in words. Update: On request to have an answer pad, please leave the app to let us know how you get in! Read moreFreeReport issues
